Hi,

This is my first post to the list, I hope somebody can help me with this problem. Apologies if it has been posted before but I have been internet searching to no avail.

What I am trying to do is provide a simple method for a user to change a config file, for a test suite. The config file consists of a number of keys, eg. build number, target device, etc.

What I would like to do is give the user a key, and the previous value for that key. The user can then accept the previous value or edit it on the line.

I have a method where the previous value of a key is presented to the user and can be accepted if the user hits return. But as some of the values are somewhat long, and the user may only need to change 1 or 2 characters, it would be a nice feature to offer line editing.

I can get the `readline.set_pre_input_hook()` function to send text after a `raw_input` prompt, but this text cannot be edited.

Thanks in advance for any help.  
Paraic.
