Sullivan WxPyQtKinter enlightened us with:

1. Are there any method (in python of course) to redirect to a web page without causing a "Back" button trap(ie, when user click the back button on their web browser, they are redirect to their current page, while their hope is probably to go back to the last page they have seen, rather than the redirection page with a "Location: url" head and blank content.)?

I don't know if this is possible using CGI. I use CherryPy, and it has an InternalRedirect method. Same is true for mod_python and Apache.

The problem with the world is stupidity. Not saying there should be a capital punishment for stupidity, but why don't we just take the safety labels off of everything and let the problem solve itself?
