It is not FREE and not python, but you can try automation software like Automation Anywhere <http://www.tethyssolutions.com/automation-software.htm> to automate this task and more. Just record your actions in web browser and it will replay it back accurately.

You can also try Workspace Macro Pro, <http://www.tethyssolutions.com/macro-automation.htm> if you don't need advanced capabilities of Automation Anywhere.

I would like to write a program that will automate the configuration of a firewall or router via HTTPS. So, I need to import the applicable certificate, and be able to configure the unit as if I was typing/selecting the appropriate fields manually using a web browser. If there is a command-line based tool that would allow me to do this, I would be more than willing to give it a try. Otherwise, is there a Python library that would do the same? Thanks.
