Hey,

I need to either:

1. View the page source of a webpage after it loads

or

2. Save the webpage to my computer after it loads (same as File > Save Page As)

urllib is not sufficient (using urlopen or something else in urllib isn't going to do the trick)

Any ideas?

Thanks,
Lara

I happen to be tweaking a module that does this as your question came in. The relevant lines are:

```
fetchparams = urllib.urlencode(fetchparams)
wwwf = urllib.urlopen("?".join([baseurl, fetchparams]))
afile = open(filename, "w")
afile.write(wwwf.read())
afile.close()
```
