The code runs successfully in lesser missions it just wont run in the extra memory available when I try to run it along with my other programs in a 3gb space.

Still, it would be helpful if you explained how "wont run" manifests: does it fail to start, does it give you an exception, does it crash, does it erase your hard disk?

I'm not aware of a 3gb Python build, but you should be able to build it yourself.

Regards,
Martin
