Just got the trunk out of svn to build 2.6 alpha on OS X 10.4(Tiger).  
No readline. I can't remember what I did to get it when I built 2.5  
but it works there. Google searches are bringing up what to do for the  
Python 2.3 that comes with OS X 10.4. Could someone point me in the  
right direction?

Thanks,  
James
