Why not try writing your own code for this first?  
If nothing else, it'll help you learn more, and may also help you understand better, the other options.

Vasudev Ram

Thanks for your reply even it was not really helpful.  
Of course some attempts to generate html from tabular data are behind me. I am trying to find help here, because I think I am not the first one, who is trying to "generate" html tables.

The purpose of my effort is to automatically and repeatedly read ZQL table and save the output of the SQL SELECT to the file in the html format. Such a "reports" can be read by user using web browser later on.

I was just trying to find if somebody here can point me to the existing tool, which is suitable for such a task.

Anyway thank you for trying me help.
