I am having a script that is doing some tests continuously. I am running it from cygwin under Windows OS and is currently using CTRL+C to stop the script. But by "ctrl+c" the script stops at that very moment. In between there are some read write operations going on files and when the script stops atonce.

I want that when I press any key say "Q" from keyboard , the script should complete that particular loop and then stop. (Hope I am able to clarify my problem).
