has the wiki partially up and running, but one of the issues, during that work, is that a number of wiki pages had "invalid unicode characters".

Funny for a wiki hosting 99.9% English text...

The new environment is using a different database for storing the wiki information, and it is balking when encountering the invalid characters.

A "database" ? I had always assumed a wiki was just a bunch of files with a human-friendly markup and a rendering/editing cgi... What's the use of a database there ?
